Office Action Summary

Application No.

10/756,163

Applicant(s)

VIJ ET AL.

Examiner

RAYMOND S. DEAN

Art Unit

2618

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 13 April 2009.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-4, 6-10, 12-16, 18-22 and 24-49 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-4, 6-10, 12-16, 18-22 and 24-49 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 12 January 2004 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO/SB/08)
- Paper No(s)/Mail Date 04/13/09.
- 4) ☐ Interview Summary (PTO-413)
- Paper No(s)/Mail Date _____.
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____.

DETAILED ACTION

Response to Arguments

1. Applicant's arguments filed April 13, 2009 with respect to the combination of the cited references changing the principle of operations behind the teachings of Keating have been fully considered but they are not persuasive.

Examiner respectfully disagrees with Applicants' assertion that the initial login procedure of Eaton is a call setup operation. The actual call setup occurs when the user clicks "send" to communicate with another person (See Eaton Section 0010 lines 25 – 28).

Examiner agrees with Applicants' on the fact that Keating teaches call setup, however, said call setup occurs when the leader sends a message to the DAP to begin the group call (See Keating Section 0027 lines 1 – 4). This setup occurs outside of the presence or status determination.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1 – 4, 6 – 10, 12 – 16, 18 – 22, 24 – 49 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hall et al. (6,032,051) in view of Eaton et al. (US 2003/0208545) in view of Oprescu-Surcobe et al. (US 2005/0009542), hereafter, Oprescu and in further view of Keating et al. (US 2004/0082352)

Regarding Claim 1, Hall teaches a method for sharing user information in a wireless communication network outside a call setup, the method comprising: sending an alert from an originator to a target, the alert including presence information about the originator and requesting presence information about the target (Figure 4, Cols. 2 lines 1 – 5, 3 lines 29 – 43, “busy” is presence information); receiving information by the originator from the target in response to the alert (Figure 4, Col. 3 lines 29 – 43), and updating presence information in the originator about the target, based on the received information (Cols. 2 lines 1 – 9, 3 lines 29 – 43, in order for the originator (A) to be able to monitor the status of a member or members of a group said originator (A) will update the status information of said member or members upon receiving the PONG message, “busy” is presence information).

Hall does not teach sending an alert from an originator to a group communication server (GCS), the alert including presence information about the originator and requesting presence information about the target; transmitting an alert from the GCS to the target; registering at the GCS that no response was received from the target; receiving information by the originator from the GCS containing information about the target in response to the alert.

Eaton teaches sending an alert from an originator to a group communication server (GCS), the alert including presence information about the originator and requesting presence information about the target (Section 0010 lines 1 – 23); receiving information by the originator from the GCS containing information about the target in response to the alert (Section 0010 lines 1 - 23).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use the sever features of Eaton in the system of Hall as an alternative means for achieving the predictable result of providing presence information.

Oprescu teaches transmitting an alert from the GCS to the target (Sections 0011 lines 16 – 18, 0021 lines 1 – 6).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use the above feature of Oprescu as an alternative means for achieving the result of determining the status or presence information of group member(s).

Keating teaches registering at a controller that no response was received from the target (Section 0025 lines 17 - 27, there will be an indication that no response was received from a target at the controller thus preventing said targets identification information from being added to the group).

Hall in view of Eaton in view of Oprescu and Keating teach a wireless talk group system in which a user, who initiates a group session, can determine the status or presence information of other group members. It therefore would have obvious to one of ordinary skill in the art at the time the invention was made to use the above indication

method of Keating as an alternative means for achieving the predictable result of determining the status or presence information of other group members.

Regarding Claim 7, Hall teaches a computer-readable medium comprising at least one instruction, which, when executed by a machine, causes the machine to perform operations for sharing user information in a wireless communication network outside of a call request, (Cols. 2 lines 1 – 5, 3 lines 4 – 15, 5 lines 65 – 67, 6 lines 1 – 2), the instructions comprising: a set of instructions to send an alert from an originator to a target, the alert including presence information about the originator and requesting presence information about the target (Figure 4, Col. 3 lines 29 – 43, “busy” is presence information); a set of instructions to receive information by the originator from the target in response to the alert (Figure 4, Col. 3 lines 29 – 43), and a set of instructions to update presence information in the originator about the target, based on the received information (Cols. 2 lines 1 – 9, 3 lines 29 – 43, in order for the originator (A) to be able to monitor the status of a member or members of a group said originator (A) will update the status information of said member or members upon receiving the PONG message, “busy” is presence information).

Hall does not teach a set of instructions to send an alert from an originator to a group communication server (GCS), the alert including presence information about the originator and requesting presence information about the target; a set of instructions to transmit an alert from the GCS to the target; a set of instructions to register at the GCS that no response was received from the target.

Eaton teaches a set of instructions to send an alert from an originator to a group communication server (GCS), the alert including presence information about the originator and requesting presence information about the target (Section 0010 lines 1 – 23).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use the sever features of Eaton in the system of Hall as an alternative means for achieving the predictable result of providing presence information.

Oprescu teaches a set of instructions to transmit an alert from the GCS to the target (Sections 0011 lines 16 – 18, 0021 lines 1 – 6).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use the above feature of Oprescu as an alternative means for achieving the result of determining the status or presence information of group member(s).

Keating teaches a set of instructions to register at a controller that no response was received from the target (Section 0025 lines 17 - 27, there will be an indication that no response was received from a target at the controller thus preventing said targets identification information from being added to the group).

Hall in view of Eaton in view of Oprescu and Keating teach a wireless talk group system in which a user, who initiates a group session, can determine the status or presence information of other group members. It therefore would have obvious to one of ordinary skill in the art at the time the invention was made to use the above indication

method of Keating as an alternative means for achieving the predictable result of determining the status or presence information of other group members.

Regarding Claim 13, Hall teaches an apparatus for sharing user information in a wireless communication network outside of a call setup, comprising: means for sending an alert from an originator to a target, the alert including presence information about the originator and requesting presence information about the target (Figure 4, 2 lines 1 – 5, Col. 3 lines 29 – 43, "busy" is presence information); means for receiving information by the originator about the target in response to the alert (Figure 4, Col. 3 lines 29 – 43), and means for updating presence information in the originator about the target, based on the received information (Cols. 2 lines 1 – 9, 3 lines 29 – 43, in order for the originator (A) to be able to monitor the status of a member or members of a group said originator (A) will update the status information of said member or members upon receiving the PONG message, "busy" is presence information).

Hall does not teach means for sending an alert from an originator to a group communication server (GCS), the alert including presence information about the originator and requesting presence information about the target; means for transmitting an alert from the GCS to the target; means for registering at the GCS that no response was received from the target; means for receiving information by the originator from the GCS containing information about the target in response to the alert.

Eaton teaches means for sending an alert from an originator to a group communication server (GCS), the alert including presence information about the originator and requesting presence information about the target (Section 0010 lines 1 –

23); means for receiving information by the originator from the GCS containing information about the target in response to the alert (Section 0010 lines 1 – 23).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use the sever features of Eaton in the system of Hall as an alternative means for achieving the predictable result of providing presence information.

Oprescu teaches means for transmitting an alert from the GCS to the target (Sections 0011 lines 16 – 18, 0021 lines 1 – 6).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use the above feature of Oprescu as an alternative means for achieving the result of determining the status or presence information of group member(s).

Keating teaches means for registering at a controller that no response was received from the target (Section 0025 lines 17 - 27, there will be an indication that no response was received from a target at the controller thus preventing said targets identification information from being added to the group).

Hall in view of Eaton in view of Oprescu and Keating teach a wireless talk group system in which a user, who initiates a group session, can determine the status or presence information of other group members. It therefore would have obvious to one of ordinary skill in the art at the time the invention was made to use the above indication method of Keating as an alternative means for achieving the predictable result of determining the status or presence information of other group members.

Regarding Claim 19, Hall teaches a system for sharing user information in a wireless communication network outside of a call setup, comprising: a memory unit (Figure 3, Col. 2 lines 1 – 5, 3 lines 9 – 11); a receiver; a transmitter (Figure 3, Col. 3 lines 11 – 15, in order to communicate bi-directionally the wireless communication device (31) must have a transmitter and receiver); and a processor coupled to the memory unit, the receiver, and the transmitter (Cols. 5 lines 65 – 67, 6 lines 1 – 2), the processor being capable of: sending an alert from an originator to a target, the alert including presence information about the originator and requesting presence information about the target (Figure 4, Col. 3 lines 29 – 43, “busy” is presence information); receiving information by the originator from the target in response to the alert (Figure 4, Col. 3 lines 29 – 43), and updating presence information in the originator about the target, based on the received information (Cols. 2 lines 1 – 9, 3 lines 29 – 43, in order for the originator (A) to be able to monitor the status of a member or members of a group said originator (A) will update the status information of said member or members upon receiving the PONG message, “busy” is presence information).

Hall does not teach a group communication server (GCS), sending an alert from an originator to a group communication server (GCS), the alert including presence information about the originator and requesting presence information about the target, receiving information by the originator from the GCS containing information that no response was received from the target in response to the alert.

Eaton teaches a group communication server (GCS) (Section 0010 lines 1 – 23), sending an alert from an originator to a group communication server (GCS), the alert

including presence information about the originator and requesting presence information about the target (Section 0010 lines 1 – 23).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use the sever features of Eaton in the system of Hall as an alternative means for achieving the predictable result of providing presence information.

Keating teaches receiving information by the originator from the controller containing information that no response was received from the target in response to the alert (Section 0025 lines 17 - 27, there will be an indication that no response was received from a target at the controller thus preventing said targets identification information from being added to the group).

Hall in view of Eaton and Keating teach a wireless talk group system in which a user, who initiates a group session, can determine the status or presence information of other group members. It therefore would have obvious to one of ordinary skill in the art at the time the invention was made to use the above indication method of Keating as an alternative means for achieving the predictable result of determining the status or presence information of other group members.

Regarding Claim 25, Hall teaches a method for sharing user information in a wireless communication network outside of a call setup, the method comprising: sending at least one alert from an originator requesting presence information about at least one target user (Figure 4, Cols. 2 lines 1 – 5, 3 lines 29 – 43, "busy" is presence information); receiving information by the originator in response to the alert (Figure 4, Col. 3 lines 29 – 43), and updating presence information in the originator about the

target the target user, based on information received (Cols. 2 lines 1 – 9, 3 lines 29 – 43, in order for the originator (A) to be able to monitor the status of a member or members of a group said originator (A) will update the status information of said member or members upon receiving the PONG message, "busy" is presence information).

Hall does not teach sending at least one alert from an originator to a group communication server (GCS), the alert including presence information about the originator and requesting presence information about the target; transmitting an alert from the GCS to the target; receiving information by the originator from the GCS containing information that no response was received in response to the alert.

Eaton teaches sending an alert from an originator to a group communication server (GCS), the alert including presence information about the originator and requesting presence information about the target (Section 0010 lines 1 - 23).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use the sever features of Eaton in the system of Hall as an alternative means for achieving the predictable result of providing presence information.

Oprescu teaches transmitting an alert from the GCS to the target (Sections 0011 lines 16 – 18, 0021 lines 1 – 6).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use the above feature of Oprescu as an alternative means for achieving the result of determining the status or presence information of group member(s).

Keating teaches receiving information by the originator from the controller containing information that no response was received from the target in response to the alert (Section 0025 lines 17 - 27, there will be an indication that no response was received from a target at the controller thus preventing said targets identification information from being added to the group).

Hall in view of Eaton in view of Oprescu and Keating teach a wireless talk group system in which a user, who initiates a group session, can determine the status or presence information of other group members. It therefore would have obvious to one of ordinary skill in the art at the time the invention was made to use the above indication method of Keating as an alternative means for achieving the predictable result of determining the status or presence information of other group members.

Regarding Claim 30, Hall teaches a computer-readable medium comprising at least one instruction, which, when executed by a machine, causes the machine to perform operations for sharing user information in a wireless communication network outside of a call request (Cols. 2 lines 1 – 5, 3 lines 4 – 15, 5 lines 65 – 67, 6 lines 1 – 2), the instructions comprising: a set of instructions to send at least one alert from an originator requesting presence information about at least one target user (Figure 4, Col. 3 lines 29 – 43, “busy” is presence information); a set of instructions to receive information by the originator in response to the alert (Figure 4, Col. 3 lines 29 – 43), and a set of instructions to update presence information in the originator about the target user, based on the information received (Cols. 2 lines 1 – 9, 3 lines 29 – 43, in order for the originator (A) to be able to monitor the status of a member or members of a group

said originator (A) will update the status information of said member or members upon receiving the PONG message, "busy" is presence information).

Hall does not teach a set of instructions to receive by the originator from the GCS containing information that no response was received from the target in response to the alert.

Eaton teaches a set of instructions to receive by the originator from the GCS containing information received from the target in response to the alert (Section 0010 lines 1 - 23).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use the sever features of Eaton in the system of Hall as an alternative means for achieving the predictable result of providing presence information.

Keating teaches a set of instructions to receive by the originator from the controller containing information that no response was received from the target in response to the alert (Section 0025 lines 17 - 27, there will be an indication that no response was received from a target at the controller thus preventing said targets identification information from being added to the group).

Hall in view of Eaton and Keating teach a wireless talk group system in which a user, who initiates a group session, can determine the status or presence information of other group members. It therefore would have obvious to one of ordinary skill in the art at the time the invention was made to use the above indication method of Keating as an alternative means for achieving the predictable result of determining the status or presence information of other group members.

Regarding Claim 35, Hall teaches an apparatus for sharing user information in a wireless communication network outside of a call setup, comprising: means for sending at least one alert from an originator requesting presence information about at least one target user (Figure 4, Cols. 2 lines 1 – 5, 3 lines 29 – 43); means for receiving information by the originator in response to the alert (Figure 4, Col. 3 lines 29 – 43), and means for updating presence information in the originator about the target user, based on the information received (Cols. 2 lines 1 – 9, 3 lines 29 – 43, in order for the originator (A) to be able to monitor the status of a member or members of a group said originator (A) will update the status information of said member or members upon receiving the PONG message, "busy" is presence information).

Hall does not teach means for sending at least one alert from an originator to a group communication server (GCS), the alert including information about the originator and requesting presence information about the target; means for transmitting an alert from the GCS to the at least one target user; means for receiving information by the originator from the GCS containing information that no response was received in response to the alert.

Eaton teaches means for sending an alert from an originator to a group communication server (GCS), the alert including information about the originator and requesting presence information about the target (Section 0010 lines 1 - 23).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use the sever features of Eaton in the system of Hall as an alternative means for achieving the predictable result of providing presence information.

Oprescu teaches means for transmitting an alert from the GCS to the target (Sections 0011 lines 16 – 18, 0021 lines 1 – 6).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use the above feature of Oprescu as an alternative means for achieving the result of determining the status or presence information of group member(s).

Keating teaches means for receiving information by the originator from the controller containing information that no response was received from the target in response to the alert (Section 0025 lines 17 - 27, there will be an indication that no response was received from a target at the controller thus preventing said targets identification information from being added to the group).

Hall in view of Eaton in view of Oprescu and Keating teach a wireless talk group system in which a user, who initiates a group session, can determine the status or presence information of other group members. It therefore would have obvious to one of ordinary skill in the art at the time the invention was made to use the above indication method of Keating as an alternative means for achieving the predictable result of determining the status or presence information of other group members.

Regarding Claim 40, Hall teaches a system for sharing user information in a wireless communication network outside of a call setup, comprising: a memory unit (Figure 3, Cols. 2 lines 1 – 5, 3 lines 9 – 11); a receiver; a transmitter (Figure 3, Col. 3 lines 11 – 15, in order to communicate bi-directionally the wireless communication device (31) must have a transmitter and receiver); and a processor coupled to the

memory unit, the receiver, and the transmitter (Cols. 5 lines 65 – 67, 6 lines 1 – 2), the processor being capable of: sending at least one alert from an originator requesting presence information about at least one target user (Figure 4, Col. 3 lines 29 – 43, “busy” is presence information); receiving information by the originator in response to the alert (Figure 4, Col. 3 lines 29 – 43), and updating presence information in the originator about the target user, based on the information received (Cols. 2 lines 1 – 9, 3 lines 29 – 43, in order for the originator (A) to be able to monitor the status of a member or members of a group said originator (A) will update the status information of said member or members upon receiving the PONG message, “busy” is presence information).

Hall does not teach a group communication server (GCS), sending an alert from an originator to a group communication server (GCS), the alert including information about the originator and requesting presence information about at least one target user, receiving information by the originator from the GCS containing information that no response was received from the target in response to the alert.

Eaton teaches a group communication server (GCS) (Section 0010 lines 1 - 23), sending an alert from an originator to a group communication server (GCS), the alert including information about the originator and requesting presence information about at least one target user (Section 0010 lines 1 - 23).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use the sever features of Eaton in the system of Hall as an alternative means for achieving the predictable result of providing presence information.

Keating teaches receiving information by the originator from the controller containing information that no response was received from the target in response to the alert (Section 0025 lines 17 - 27, there will be an indication that no response was received from a target at the controller thus preventing said targets identification information from being added to the group).

Hall in view of Eaton and Keating teach a wireless talk group system in which a user, who initiates a group session, can determine the status or presence information of other group members. It therefore would have obvious to one of ordinary skill in the art at the time the invention was made to use the above indication method of Keating as an alternative means for achieving the predictable result of determining the status or presence information of other group members.

Regarding Claims 2, 8, 14, 20, Hall in view of Eaton in view of Oprescu and in further view of Keating teaches all of the claimed limitations recited in Claims 1, 7, 13, 19. Hall further teaches wherein said sending includes sending a group alert to a group of targets (Col. 3 lines 29 – 43), said receiving includes receiving presence information from the group of targets (Col. 3 lines 29 – 43), and said updating includes updating presence information about the group of targets (Cols. 2 lines 1 – 9, 3 lines 29 – 43, in order for the originator (A) to be able to monitor the status of a member or members of a group said originator (A) will update the status information of said member or members upon receiving the PONG message).

Regarding Claims 3, 9, 15, 21, Hall in view of Eaton in view of Oprescu and in further view of Keating teaches all of the claimed limitations recited in Claims 2, 8, 14,

20. Hall further teaches updating presence information in at least one target based on information received from the originator (Col. 3 lines 29 – 43).

Regarding Claims 4, 10, 16, 22, Hall in view of Eaton in view of Oprescu and in further view of Keating teaches all of the claimed limitations recited in Claims 2, 8, 14, 20. Hall further teaches updating presence information in at least one target based on information received from at least another target in the group (Cols. 2 lines 1 – 9, any group member, which comprises a target, can monitor the status of other group members, which comprises targets, thus any group member has the capability to update the status information of the other group members).

Regarding Claims 6, 12, 18, 24, Hall in view of Eaton in view of Oprescu and in further view of Keating teaches all of the claimed limitations recited in Claims 1, 7, 13, 19. Hall further teaches wherein said presence information includes location information (Figure 17, Col. 6 lines 54 – 60, L=lunch or M=meeting is location information).

Regarding Claims 26, 31, 36, 41, Hall in view of Eaton in view of Oprescu and in further view of Keating teaches all of the claimed limitations recited in Claims 25, 30, 35, 40. Hall further teaches wherein said requesting includes requesting presence information about a group of target users (Col. 3 lines 29 – 43), and said receiving includes receiving information as to whether the group is active or passive (Figure 17, Cols. 2 lines 1 – 9, 6 lines 54 – 60, idle is passive, busy is active).

Regarding Claims 27, 32, 37, 42, Hall in view of Eaton in view of Oprescu and in further view of Keating teaches all of the claimed limitations recited in Claims 25, 30,

35, 40. Hall further teaches wherein said requesting includes requesting presence information about a group of target users (Col. 3 lines 29 – 43), and said receiving includes receiving information as to which target user in the group is registered (Figure 17, Cols. 4 lines 8 – 21, 6 lines 54 – 60, if the device is switched on said device is registered).

Regarding Claims 28, 33, 38, 43, Hall in view of Eaton in view of Oprescu and in further view of Keating teaches all of the claimed limitations recited in Claims 25, 30, 35, 40. Hall further teaches wherein said requesting includes requesting presence information about a group of target users (Col. 3 lines 29 – 43), and said receiving includes receiving information as to which target user is participating in a current communication session (Figure 17, Cols. 2 lines 1 – 9, 6 lines 54 – 60, idle is passive, busy comprises participating in a current communication session).

Regarding Claims 29, 34, 39, 44, Hall in view of Eaton in view of Oprescu and in further view of Keating teaches all of the claimed limitations recited in Claims 25, 30, 35, 40. Hall further teaches wherein said requesting includes requesting presence information about a group of target users (Col. 3 lines 29 – 43), and said receiving includes receiving location information for the target users (Figure 17, Col. 6 lines 54 – 60, L=lunch or M=meeting is location information).

Regarding Claim 46, Hall in view of Eaton in view of Oprescu and in further view of Keating teaches all of the claimed limitations recited in Claim 1. Eaton further teaches wherein the information received by the originator from the GCS is a group

response message containing information about more than one target in a single message (Section 0010 lines 1 - 23, contact lists comprise more than one target).

Regarding Claim 48, Hall in view of Eaton in view of Oprescu and in further view of Keating teaches all of the claimed limitations recited in Claim 1. Oprescu further teaches wherein transmitting the alert from the GCS to the target is performed in response to the request for presence information about the target (Section 0021 lines 1 – 6).

Regarding Claim 49, Hall in view of Eaton in view of Oprescu and in further view of Keating teaches all of the claimed limitations recited in Claim 1. Eaton further teaches wherein sending the alert from the originator to the GCS is performed subsequent to completing a call setup for the originator (Section 0010 lines 25 – 28, the actual call setup occurs when the user clicks “send” to communicate with another, this renders the following scenario-user logs in, user sends presence information about user to the server, user receives presence information about other users from said server, user clicks send to communicate with desired users, which is the call setup process, user logs off, user logs on again at a later time and sends presence information and receives presence information, this second logon and presence determination occurs after the first call setup).

4. Claim 45 is rejected under 35 U.S.C. 103(a) as being unpatentable over Hall et al. (6,032,051) in view of Eaton et al. (US 2003/0208545) in view of Oprescu-Surcobe et

al. (US 2005/0009542) in view of Keating et al. (US 2004/0082352), as applied to Claim 1 above, and further in view of Salmi (US 20030037103)

Regarding Claim 45, Hall in view of Eaton in view of Oprescu and in further view of Keating teaches all of the claimed limitations recited in Claim 1. Hall in view of Eaton in view of Oprescu and in further view of Keating does not teach wherein transmitting the alert from the GCS to the target occurs before sending the alert from the originator GCS.

Salmi, which also teaches a wireless system the manages presence information, teaches transmitting the alert from the GCS to the target occurs before sending the alert from the originator GCS (Section 0036 lines 22 – 27, the presence information is provided on an ongoing basis to the subscribing users thus rendering a scenario wherein the server sends out alerts on an ongoing basis to the subscribing users when an updating user other than the originator updates the presence information).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use the above feature of Salmi as an alternative means for achieving the predictable result of managing presence information.

5. Claim 47 is rejected under 35 U.S.C. 103(a) as being unpatentable over Hall et al. (6,032,051) in view of Eaton et al. (US 2003/0208545) in view of Oprescu-Surcobe et al. (US 2005/0009542) in view of Keating et al. (US 2004/0082352), as applied to Claim 1 above, and further in view of Berger et al. (US 2004/0267887)

Regarding Claim 47, Hall in view of Eaton in view of Oprescu and in further view of Keating teaches all of the claimed limitations recited in Claim 1. Hall in view of Eaton in view of Oprescu and in further view of Keating does not teach wherein the information received by the originator from the GCS includes an indication of which members in a given group are participating in a group communication session.

Berger, which also teaches a wireless system that manages presence information, teaches wherein the information received by the originator from the GCS includes an indication of which members in a given group are participating in a group communication session (Section 0050, group communication sessions comprise meetings (IN MEETING)).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use the above feature of Berger as an alternative means for achieving the predictable result of managing presence information.

Conclusion

6. Any inquiry concerning this communication or earlier communications from the examiner should be directed to RAYMOND S. DEAN whose telephone number is (571)272-7877. The examiner can normally be reached on Monday-Friday 6:00-2:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Edward F. Urban can be reached on 571-272-7899. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
